

## TWIN CREEKS MYOBATRACHIDAE GROUND FROGS

No Tree Frogs (Hylidae) were captured during this survey. If they did happen to fall into a Pit Trap they would probably have easily jumped out anyway so the survey doesn't suggest that there are no Tree Frogs at Twin Creeks. All the frogs that were captured were Ground Frogs.

All very small frogs with long unwebbed toes. The 2 species on this page can really only be ID'd apart by their eyes and their calls.

190403 *Crinia pseudinsignifera* DSC08791

The Quacking Frog is by far the biggest of the Crinias & also has red in the groin & bright yellow iris' and gold eyelids.

This group of Frogs can easily be identified by their very stumpy legs – relative to their bodies and males have robust forearms. 3 of them were trapped over the 5 days of this survey
